READ THESE INSTRUCTIONS FIRST

Write your Centre number, candidate number and name in the spaces provided.
Write in dark blue or black pen.
You may use an HB pencil for any diagrams or graphs.
Do not use staples, paper clips, glue or correction fluid.
DO NOT WRITE IN ANY BARCODES.

Write your answer to each question in the space provided.
If additional space is required, you should use the lined pages at the end of the booklet.
The question number(s) must be clearly shown.

Answer all questions.

The Insert contains Figs. 1.1, 1.2, 1.3, 1.4 and Tables 1.2, 1.3 and 1.4 for Question 1, and Table 2.1 for Question 2.
The Insert is not required by the Examiner.
Sketch maps and diagrams should be drawn whenever they serve to illustrate an answer.

At the end of the examination, fasten all your work securely together.
The number of marks is given in brackets [ ] at the end of each question or part question.

This syllabus is approved for use in England, Wales and Northern Ireland as a Cambridge International Level 1/Level 2 Certificate.

This document consists of 19 printed pages, 1 blank page and 1 Insert.
Students in England did fieldwork at twelve sites on a stream called Ashes Hollow. It flows for about 5 km from where the stream begins, until it joins the stream called Quinny Brook. They selected six sites upstream of a waterfall, and six sites downstream of it. Fig. 1.1 (Insert) shows Ashes Hollow and Fig. 1.2 (Insert) shows the waterfall.

(a) Choose from the table below the correct geographical word for

| confluence | meander | mouth | source | watershed |

(i) ‘where the stream begins’ .................................... [1]
(ii) ‘it joins the stream called Quinny Brook.’ .................................... [1]

The two hypotheses which the students tested were:

**Hypothesis 1:** The cross sectional area of the channel increases downstream.

**Hypothesis 2:** Sinuosity is greater downstream of the waterfall.

Sinuosity is a measurement of how much a river meanders. A higher sinuosity score shows that the river meanders more.

Fig. 1.3 (Insert) shows a method to calculate sinuosity.
(b) Before they began their fieldwork the students assessed the possible hazards they may come across. Their decisions are shown in Table 1.1 below.

### Table 1.1

<table>
<thead>
<tr>
<th>Hazard</th>
<th>Likelihood</th>
<th>Severity</th>
<th>Risk</th>
<th>Management</th>
</tr>
</thead>
<tbody>
<tr>
<td>Walking along the side of the road to the valley</td>
<td>1</td>
<td>5</td>
<td>5</td>
<td>Shout warnings, keep to one side of the road</td>
</tr>
<tr>
<td>Weather conditions in the valley</td>
<td>3</td>
<td>2</td>
<td>6</td>
<td>Wear suitable clothing</td>
</tr>
<tr>
<td>Rocks falling from the valley side</td>
<td>2</td>
<td>3</td>
<td>6</td>
<td>Do not go underneath rocks on the valley side</td>
</tr>
<tr>
<td>Slippery surfaces in and around the river</td>
<td>4</td>
<td>3</td>
<td>12</td>
<td></td>
</tr>
<tr>
<td>Fast currents in the river</td>
<td>3</td>
<td>3</td>
<td>9</td>
<td></td>
</tr>
<tr>
<td>Catch disease from the river water</td>
<td>2</td>
<td>3</td>
<td>6</td>
<td></td>
</tr>
</tbody>
</table>

Likelihood of encountering hazard: 1 (little chance) to 5 (greatest chance)
Severity of hazard: 1 (not likely to be dangerous) to 5 (very dangerous)
Risk = likelihood of encountering hazard × severity of hazard

(i) Which one of the possible hazards did the students consider to have the greatest risk? ....................................................................................................................................... [1]

(ii) Suggest different ways to manage each of the following hazards during fieldwork:

Slippery surfaces in and around the river
...........................................................................................................................................
...........................................................................................................................................

Fast currents in the river
...........................................................................................................................................
...........................................................................................................................................

Catch disease from the river water
...........................................................................................................................................
...........................................................................................................................................[3]
(c) To test their hypotheses the students made three measurements at each of the twelve sites. They measured the width of the channel, the depth of the channel, and the sinuosity of the channel. Their methods are shown in three photographs in a student’s notebook, Fig. 1.4 (Insert).

In the table below match each photograph to the method it shows.

<table>
<thead>
<tr>
<th>Measurement method</th>
<th>Photograph (A, B, C)</th>
</tr>
</thead>
<tbody>
<tr>
<td>width of channel</td>
<td></td>
</tr>
<tr>
<td>depth of channel</td>
<td></td>
</tr>
<tr>
<td>channel sinuosity</td>
<td></td>
</tr>
</tbody>
</table>

(d) The results of the students' measurements for Hypothesis 1: *The cross sectional area of the channel increases downstream*, are shown in Table 1.2 (Insert).

(i) Which one of the following is the correct method to calculate cross sectional area? Tick (√) your choice.

<table>
<thead>
<tr>
<th>Method</th>
<th>Tick (√)</th>
</tr>
</thead>
<tbody>
<tr>
<td>average depth plus width</td>
<td></td>
</tr>
<tr>
<td>average depth minus width</td>
<td></td>
</tr>
<tr>
<td>average depth multiplied by width</td>
<td></td>
</tr>
</tbody>
</table>
(ii) Use the results in Table 1.2 to **plot the cross sectional area** at site 3 on Fig. 1.5 below. [1]

![Channel cross sectional area graph]

- **Fig. 1.5**

(iii) To what extent do the results shown in Fig. 1.5 support **Hypothesis 1**: **The cross sectional area of the channel increases downstream**? Circle your decision below and support it with evidence from Fig. 1.5 and Table 1.2.

<table>
<thead>
<tr>
<th></th>
<th>completely</th>
<th>partially</th>
<th>not at all</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................[4]
(e) To investigate Hypothesis 2: Sinuosity is greater downstream of the waterfall, the students measured the sinuosity at the twelve sites upstream and downstream of the waterfall. (Sinuosity is a measurement of how much a river meanders. A higher sinuosity score shows that the river meanders more.)

Their results are shown in Table 1.3 (Insert).

(i) Use the results to plot the sinuosity score at site 10 on Fig. 1.6 below.

![Sinuosity scores along the stream](image)

Key

<table>
<thead>
<tr>
<th>sites upstream of waterfall</th>
</tr>
</thead>
<tbody>
<tr>
<td>sites downstream of waterfall</td>
</tr>
</tbody>
</table>

(ii) What conclusion did the students make about Hypothesis 2: Sinuosity is greater downstream of the waterfall? Use evidence from Fig. 1.6 and Table 1.3 to support the conclusion.

[Total: 30]
A class of students in the UK wanted to investigate how the quality of the urban environment varied between different areas of their town. They decided to do an environmental quality survey.

The students decided to focus their investigation on four types of land use:
- industry
- open space
- residential (housing)
- shops.

They concentrated their investigation on the following hypotheses:

**Hypothesis 1:** The quality of the urban environment varies between different types of land use.

**Hypothesis 2:** The quality of the urban environment improves as distance from the town centre increases.
(a) The students selected 20 sites (including 5 of each land use) to do their environmental quality survey. At each chosen site there was one main land use. The sites varied in distance from the town centre.

The location of the survey sites are shown on Fig. 2.1 below.

Location of survey sites in the town

![Location of survey sites in the town](image)

<table>
<thead>
<tr>
<th>Land use</th>
<th>Reference</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Fig. 2.2
(i) **Complete the Traffic category** by writing the following descriptions in the correct order on Fig. 2.2.

Traffic not moving with many parked vehicles

Traffic moving slowly with many parked vehicles

Traffic moving freely with few parked vehicles \[1\]

(ii) Suggest advantages of using the reference sheet during the environmental quality survey.

...........................................................................................................................................

...........................................................................................................................................

...........................................................................................................................................

........................................................................................................................................... \[2\]

(iii) The students agreed to work in four groups with each group doing the environmental quality surveys in one type of land use. Each group did their surveys at different times of the day. Why might this make the results less reliable?

...........................................................................................................................................

........................................................................................................................................... \[1\]

(iv) Give two pieces of advice about safety which the students would be given by their teacher.

1 ...........................................................................................................................................

...........................................................................................................................................

2 ...........................................................................................................................................

........................................................................................................................................... \[2\]
(c) (i) The students needed to record the results of their environmental quality survey. In Fig. 2.3 below, **draw a results sheet** which they could use to record results at each site they visited. [3]

**Environmental Quality Survey Results Sheet**

Site reference number  .......................
(ii) The results of the environmental quality survey are shown in Table 2.1 (Insert). Use these results to complete the dispersion graph in Fig. 2.4 below. **Plot the environmental quality score** of:
- the residential site R1
- the average (mean) value for industry.

![Dispersion Graph]

**Results of environmental quality survey**

![Environmental Quality Scores Table]

**Key**
- average (mean) value

**Fig. 2.4**

(iii) The students’ conclusion was that **Hypothesis 1**: The quality of the urban environment varies between different types of land use is true. Do you agree with this conclusion? Support your decision with evidence from Fig. 2.4 and Table 2.1.
(iv) Suggest reasons why there is variation in the quality of the environment between
*industrial* sites in an urban area.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................[3]

(d) The students used the results of the environmental quality survey (Table 2.1) to consider
**Hypothesis 2:** *The quality of the urban environment improves as distance from the town
centre increases.*

(i) Use the results in Table 2.1 to **plot the environmental quality score of the shops site**
*S5* on the scatter graph, Fig. 2.5, below. [1]

![Fig. 2.5](image-url)
(ii) The students made a conclusion that Hypothesis 2: *The quality of the urban environment improves as distance from the town centre increases* was false. Support this conclusion with evidence from Fig. 2.5 and Table 2.1.

...........................................................................................................................................
