Fig. 1.1 shows students about to start a 50.0 m swimming race.

(a) The length of the pool is 50.0 m.

Name a suitable piece of equipment that could be used to measure the length of the pool.
........................................................................................................................................................................[1]

(b) The race starts and the students swim to the end of the 50.0 m pool.

Fig. 1.2 shows the times recorded on the stop watches for the winner and the swimmer in second place.

![Stop watches](image)

Fig. 1.2

(i) Determine the time taken by the winner to swim 50.0 m. Use information from Fig. 1.2.

winner’s time = .......................................................... s [1]

(ii) Calculate the average speed of the winner.

average speed = .................................................. m/s [2]

(iii) Calculate the time difference between the winner and the swimmer in second place.

time difference = ...................................................... s [1]

[Total: 5]
2 (a) The walls of a room are to be painted. A tin of paint has a total mass of 7000 g and a volume of 5000 cm$^3$. The empty tin has a mass of 500 g.

(i) Determine the mass of the paint.

mass of paint = ...................................................... g [1]

(ii) Calculate the density of the paint. Include the unit.

density = ......................................................... [3]

(b) The painter drops a brush into the tin of paint. The brush floats.

Suggest why the brush floats.

...................................................................................................................................................
............................................................................................................................................... [1]

[Total: 5]
Fig. 3.1 shows a large sunshade.

The arm holding the sunshade pivots about the end of a support.

(a) The sunshade has a mass of 20.0 kg.

Calculate the weight of the sunshade.

weight = ..................................................... N [3]

(b) (i) Another sunshade is shown in Fig. 3.2.
This sunshade weighs 180 N.
The arm holding the sunshade extends 2.5 m from the pivot.

Calculate the moment of the sunshade about the pivot.

moment = .................................................. N m [3]
(ii) How can the moment produced by the sunshade be reduced? Tick one box.

- [ ] by decreasing the height of the support
- [ ] by decreasing the length of the arm holding the sunshade
- [ ] by increasing the weight of the base
- [ ] by increasing the weight of the sunshade

A house has white wooden walls and a black wooden door, as shown in Fig. 4.1.

**Fig. 4.1**

(a) The Sun is shining on the door and the front wall of the house.

(i) State the name of the process by which thermal energy is transferred from the Sun to the Earth.

(ii) Fig. 4.2 shows part of the white wall and the black door of the house. Two thermometers have been attached, one to the wall and the other to the door.

**Fig. 4.2**

Thermometer A measures the temperature of the white wall. Thermometer B measures the temperature of the black door.

The thermometer readings are recorded after the Sun has been shining on the house for some time.

Suggest which thermometer has the higher temperature and explain why.

higher temperature .................................................................

explanation ........................................................................
...........................................................................................................
...........................................................................................................
...........................................................................................................
...........................................................................................................
...........................................................................................................[3]
(b) The air conditioning unit inside a room in the house is switched on. The air conditioning unit takes in warm air and gives out cold air, as shown in Fig. 4.3.

![Diagram of air conditioning unit and room](image)

**Fig. 4.3**

Explain how the air conditioning unit cools all the air in the room.

A deep-sea diver on a diving-boat experiences atmospheric pressure. When she is working underwater, she experiences an increased pressure.

State two factors that affect the size of the increased pressure.

1. ...............................................................................................................................................

2. .............................................................................................................................................[2]
(c) Fig. 5.2 shows a device used for measuring atmospheric pressure.

(i) State the name of the device shown in Fig. 5.2.

..................................................................................................................................................................................[1]

(ii) Fig. 5.3 shows a manometer connected to a gas supply. The pressure of the gas supply is greater than atmospheric pressure. Atmospheric pressure is equal to 1033.6 cm of water.

Determine the pressure of the gas supply.

pressure = ..................................... cm of water [3]

[Total: 8]
Fig. 6.1 shows an overhead view of two cars approaching a road junction. A plane mirror helps the drivers to see other cars.

(i) A ray of light from car 1 is shown.

On Fig. 6.1, clearly draw the normal to the plane mirror where this ray hits the plane mirror. Label the normal N. [1]

(ii) On Fig. 6.1, carefully draw the reflected ray of light. [1]

(iii) State the law used in your answer to (a)(ii).
............................................................................................................................................[1]

(iv) Can each driver see the other car?
............................................................................................................................................

Explain your answer.
............................................................................................................................................[1]
(b) Fig. 6.2 shows a ray of light incident on a glass block.

(i) On Fig. 6.2, continue the path of the ray into the block. [1]

(ii) On Fig. 6.2, clearly label the angle of incidence $i$ and the angle of refraction $r$. [2]

[Total: 7]
Fig. 7.1 shows the regions of the electromagnetic spectrum.

<table>
<thead>
<tr>
<th>radio waves</th>
<th>microwaves</th>
<th>infra-red waves</th>
<th>1</th>
<th>ultraviolet waves</th>
<th>X-rays</th>
<th>2</th>
</tr>
</thead>
</table>

**Fig. 7.1**

(a) (i) Give the names of the two regions that are labelled 1 and 2.

1. ...............................................................................................................................  
2. ............................................................................................................................... [2]

(ii) Use words from the box to complete the sentence.

<table>
<thead>
<tr>
<th>acceleration</th>
<th>amplitude</th>
<th>frequency</th>
<th>speed</th>
<th>wavelength</th>
</tr>
</thead>
</table>

Compared with other regions in the electromagnetic spectrum, radio waves have the largest ........................................ and the smallest ........................................... . [2]

(b) Sound is not an electromagnetic wave.

Give one other way in which sound waves are different from radio waves.

...........................................................................................................................................[1]

(c) Two students, X and Y, carry out an experiment to determine the speed of sound in air.

X has two blocks of wood that make a loud, sharp sound when banged together.  
Y has a tape measure and a stopwatch.

Describe how X and Y can use the equipment to measure the speed of sound in air.

8 (a) Fig. 8.1 shows a bar magnet.

![Diagram of a bar magnet with North (N) and South (S) poles labeled.](image)

Fig. 8.1

On Fig. 8.1, draw lines to show the shape of the magnetic field around the bar magnet. Include at least one arrow to show the direction of the field. [3]

(b) Explain how a coil of wire can be used to create a bar magnet from a suitable piece of metal.

...................................................................................................................................................
...................................................................................................................................................
................................................................................................................................................... [2]

(c) Which of these metals could be used to make a bar magnet? Tick one box.

- aluminium
- copper
- soft iron
- steel

[1]

[Total: 6]
Fig. 9.1 shows a current-carrying coil in a magnetic field.

The direction of the current in side AB of the coil is labelled. The force F on side AB is also labelled.

(a) On Fig. 9.1, draw

- an arrow labelled X, on side CD, to show the direction of the current in this side of the coil,
- an arrow labelled P, to show the direction of the force on CD.

(b) Give two ways of increasing the forces F and P on the sides of the coil.

1. ...............................................................................................................................................
   ...................................................................................................................................................

2. ...............................................................................................................................................
   ...................................................................................................................................................
(c) (i) Name the particles that flow in the metal wire of the coil.

........................................................................................................................................................................[1]

(ii) The wire of the coil is replaced by a thinner wire. This wire is the same length and is made of the same metal.

State and explain how this changes the current in the coil.

........................................................................................................................................................................

[Total: 7]
A student wants to investigate how the resistance of a light-dependent resistor (LDR) varies with the brightness of the light in the room.

(a) To investigate this, the student connects the circuit shown in Fig. 10.1.

The student has made three errors.

Identify the three errors in the student’s circuit.

1. ...............................................................................................................................................
   ...................................................................................................................................................
2. ...............................................................................................................................................
   ...................................................................................................................................................
3. ...............................................................................................................................................
   ................................................................................................................................................... 

[3]
(b) The student corrects the errors. His results are shown in Fig. 10.2.

Fig. 10.2

(i) Use the information in Fig. 10.2 to describe how the brightness of the light in the room affects the resistance of the LDR.

...........................................................................................................................................
...........................................................................................................................................
...........................................................................................................................................[1]

(ii) The potential difference across the LDR is 8.0 V.

Calculate the current in the LDR when the light is 60% of full brightness.

\[
\text{current} = \text{...................................................... A} \quad [4]
\]

11 (a) The plug for a television contains a fuse. Explain the purpose of the fuse. 
...................................................................................................................................................
...................................................................................................................................................
...................................................................................................................................................[2]

(b) The circuit of the television includes transformers. 

(i) State the metal used for the two coils of each transformer. 
...................................................................................................................................................[1]

(ii) One transformer has an input voltage of 224 V and an output voltage of 16.0 V. The input coil contains 308 turns. Calculate the number of turns on the output coil. 

number of turns = ......................................................... [3]

[Total: 6]
Fig. 12.1 represents the particles in an atom of the element lithium.

(a) (i) State the name of particle X.
...........................................................................................................................................[1]

(ii) State the charge of particle X.
...........................................................................................................................................[1]

(iii) Tick one box in Fig. 12.2 that correctly represents an isotope of lithium.

Fig. 12.2

(b) A sample of lithium contains 1.00 mg of a radioactive isotope of lithium.
Calculate the mass of the isotope that remains after 2 half-lives.

\[
\text{mass} = \text{................................................... mg} \quad [2]
\]
